### Section 'A' (Reading - 20 marks)

1 Read the following passage carefully and answer the questions that follow : 4×3=12

Malaria is a masquito-borne infection disease caused by plasmodium. Each year, there are approximately 300-500 million cares of malaria, killing between one and three million people. About 90% of cases deaths occur in Africa. It is commonly associated with poverty.

Malaria is transmitted by the bite of female Anopheles mosquito. When a mosquito bites an infected person, a small amount of blood is taken, which contains malaria parasites. These develop within a mosquito, and about one week later, when the mosquito takes its next blood meal, the parasites are injected with the mosquito's saliva on to the person being bitten. After a period of between two weeks and several months spent in the liver, The malaria parasites start to multiply within red blood cells, causing symptoms that include fever and headache. In severe cases, the disease worsens leading to come and death.

The transmisson of malaria can be reduced by preventing mosquito bites by distribution of inexpensive mosquito nets and insect repellents, or by mosquito control measures such as spraying insecticides.

(a) What is malarja?
(b) How malaria is transmitted?
(c) What are the consequences of severe mararia?
